# The Social Nature of Attitudes: Using ResIn to explore complex attitude-identity systems

---

Adrian Lüders

Centre for Social Issues Research  
University of Limerick, Ireland

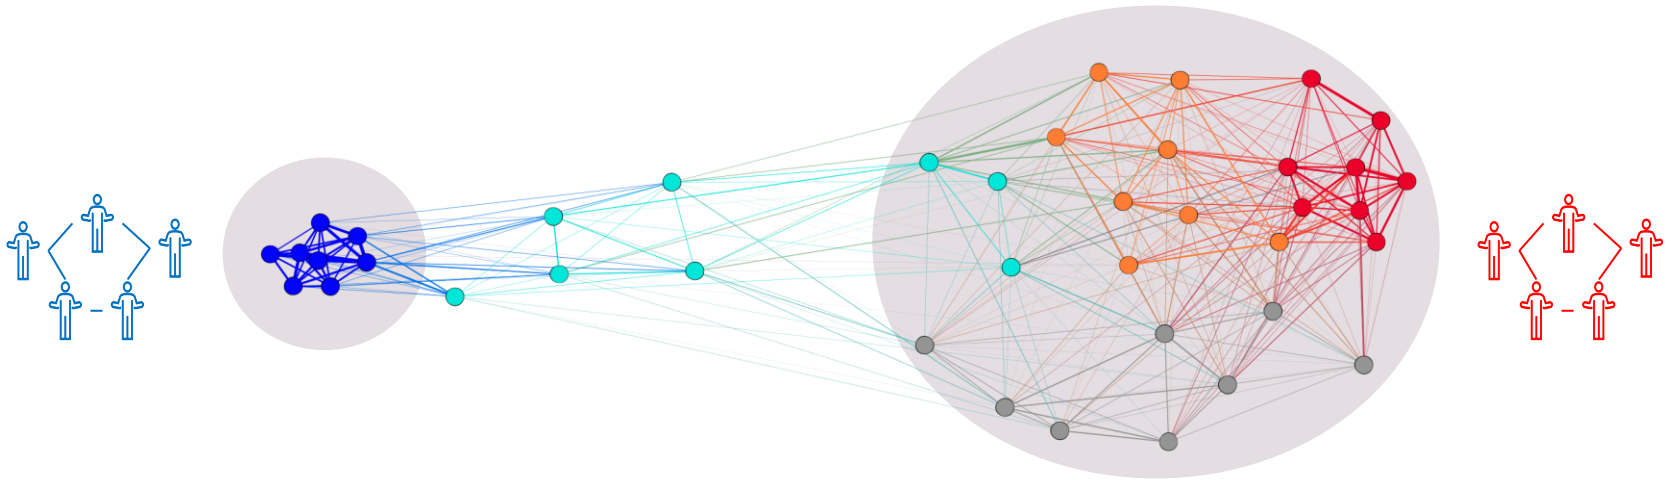

# Using ResIn to explore complex attitude-identity systems

- Nodes reflect item responses (e.g. *I strongly agree/ mildly agree that ....*)
- Node positions obtained via forced-direction algorithm
- Relative proximity indicates correlation strength between nodes

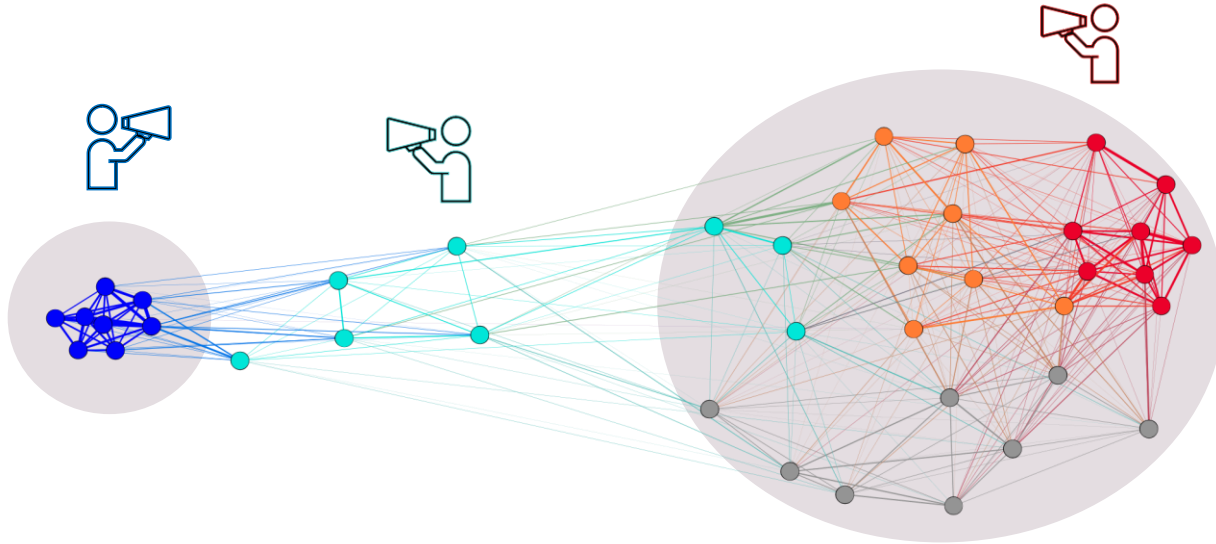

# Using ResIn to explore complex attitude-identity systems

1) Attitude cluster (i.e. shared belief systems) provide a substrate for social identities

# Using ResIn to explore complex attitude-identity systems

2) People rely on their mental representations of attitudes to organize and express identities

# Using ResIn to explore complex attitude-identity systems

3) Misrepresentations of attitude-identity systems result from group biases

---

**Let's start with some  
theory**

# Jimmy's Pizza Party 🍕

---

**Jim:** Hey folks, do you also feel hungry? How about ordering some pizza?

**Crowd:** Amazing idea Jimmy! We all LOVE Pizza!!

**Jim:** Awesome! Give me your orders!

**Crowd:** Margarita for me! Pizza Funghi here! ...Capricciosa per favore!!

**...Pizza Hawaii please!!!**

# Jimmy's Pizza Party 🍕

# Consensus as a basis for shared selfhood

# Consensus as a basis for shared selfhood

---

- Literature on “Opinion-Based Groups” suggests that shared (dis)agreement provides a solid basis for shared group membership (Bliuc et al. 2007)
- Attitude-sharing can (temporarily) unite people from different socio-demographic and/or ideological backgrounds to fight for a common cause (McCarthy et al. 2014; Lueders et al. 2021)
- Social identities stemming from attitude sharing are a better predictor for (online) collective action than group membership that is defined by stable social categories (Meta Analysis by Akfirat et al. 2021)

# Consensus as a basis for shared selfhood

#Hashtag

- Attitude expression is a key element of online communication where it promotes community building (Lueders et al. 2022)
- A growing number of US Twitter users includes political attitudes as self-descriptions in profile bios (Jones & Rogers, 2021)
- Experimental evidence that attitude sharing increases the readiness for social identification (over minimal group assignment, O'Reilly et al. 2022)

# Attitude-Identity-Systems are dynamic!

- While communicating, people interactively define the meaning of the attitudes that unite them (Turner & Oakes, 1986)
- These processes often occur in the wider social context and include definitions of “ingroups” and “outgroups” (Postmes et al. 2005)
- **Attitudes become “charged” with identity and vice versa!**

# Attitude expression is identity expression!

- Individuals develop mental representations of existing attitude-identity relationships
- Individuals become “*recognizable*” as group members through the attitudes that they express
- Attitude change becomes synonymous with identity change

# Complex Attitude-Identity-Systems

Problem: Often groups cannot be defined by a single “core” attitude (e.g. support vs opposition for an issue, candidate etc.); they are based on more complex attitude-identity relationships!

# Complex Attitude-Identity-Systems

Accessible

Compact identity signifier (e.g. Hashtag, Symbol)

Inaccessible

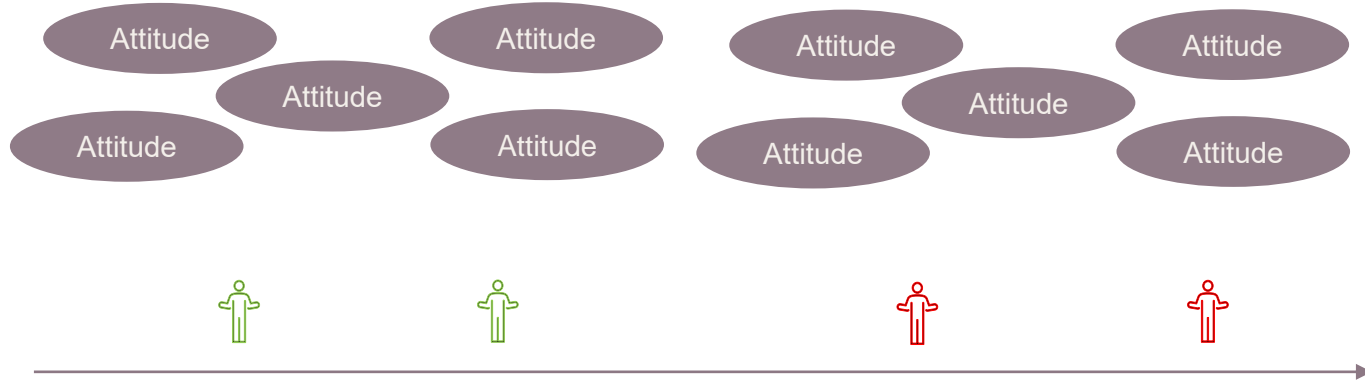

Accessible

Latent Identities (e.g. Democrat, Republican, Environmentalist, Capitalist)

# Complex Attitude-Identity-Systems

ResIN offers a solution to this research challenge by:

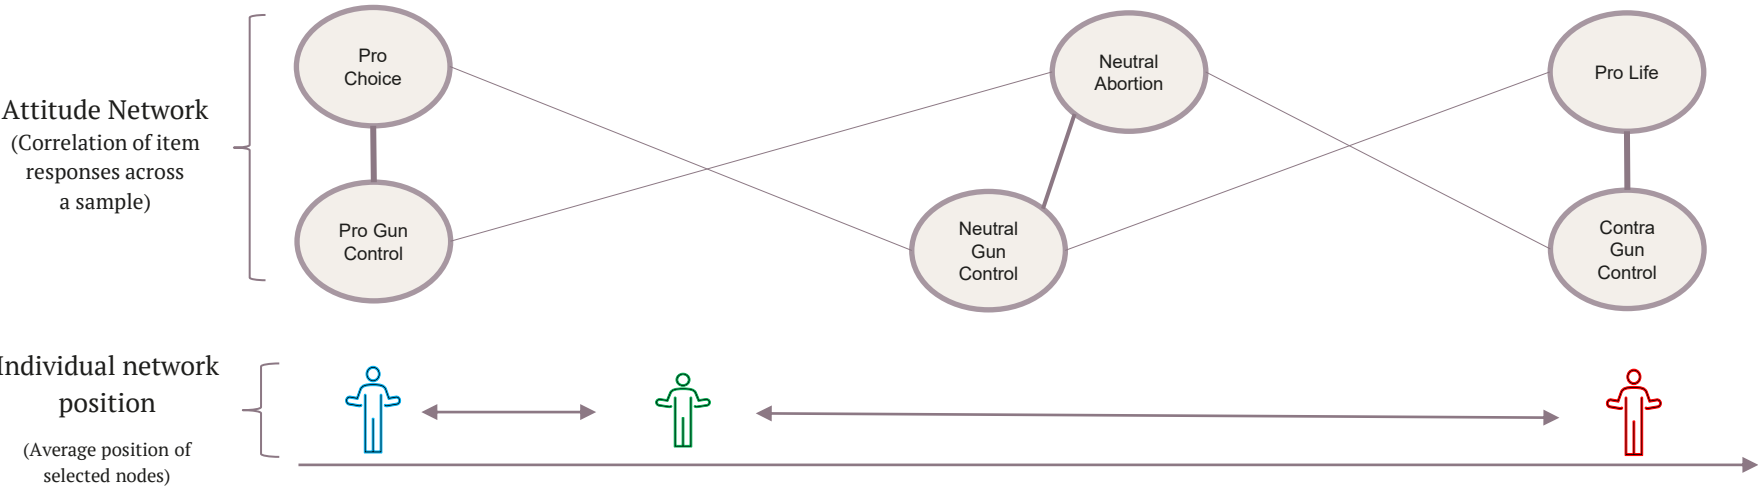

- Modelling complex attitude-relationships across a sample as a spatial network and
- Locating individual participants on a network-axis

# Response Item Network

(ResIN, Carpentras, Lueders, & Quayle, 2021)

- 
- **Now let's look at some data**

# Overview of Studies

## 2 Datasets test the following claims in the context of the US electorate:

- Study 1a) Attitude cluster in the ResIN Network correspond to latent group identities
- Study 1b) Attitudes signal identity, hence allowing *attitude observers* to categorize *attitude holders* as ingroup or outgroup members
- Study 2) Mental representations of attitude-identity relationships are shaped by group biases

---

Lüders, A., Carpentras, D., & Quayle, M. (under review). Using  
Network Modelling to Explore Complex Attitude-Identity  
Relationships in the Intergroup Context.

Study 1a: Predicting latent group identities from attitude structures

- Procedure
- Online recruitment of US partisans (N = 398, 48.7% female, 50.05% male, 18-81 years, 58,1% Democrats, 13.9% Republicans, 28% Independents)
- Modelling a ResIN network based on eight “hot-button issues” (8 items rated on a 5-point scale = 40 nodes)
- Predicting latent self-reported identities from participants’ network positions
- Robustness Check with >8000 ANES participants

## Study 1a: Predicting latent group identities from attitude structures

Thinking about the USA today, please indicate the extent to which you agree with each of the following statements:

	Strongly Disagree	Somewhat Disagree	Neutral	Somewhat Agree	Strongly Agree
Abortion should be illegal.	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
The government should take steps to make incomes more equal.	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
All unauthorized immigrants should be sent back to their home country.	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
The federal budget for welfare programs should be increased.	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
Lesbian, gay and trans couples should be allowed to legally marry.	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
The government should regulate business to protect the environment.	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
The federal government should make it more difficult to buy a gun.	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
The federal government should make a concerted effort to improve social and economic conditions for African Americans.	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>

## Study 1a: Predicting latent group identities from attitude structures

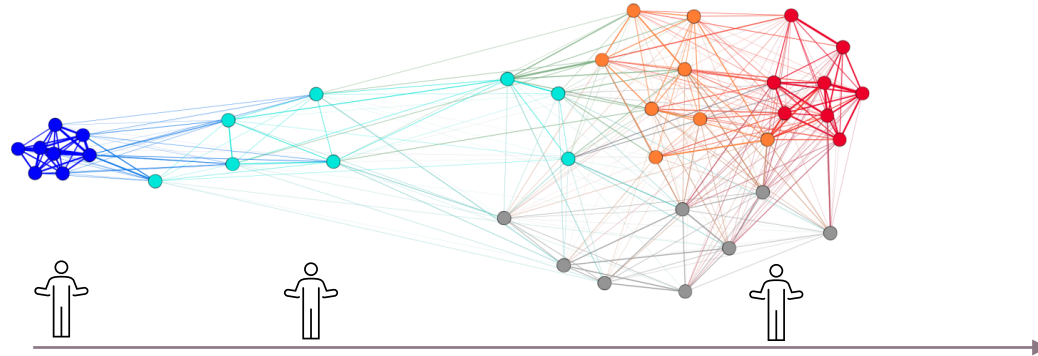

Strongly Agree - Weakly Agree – Neutral - Weakly Disagree - Strongly Disagree

Democrat belief system  
Republican belief system

## Study 1a: Predicting latent group identities from attitude structures

H1: The position of a participant within the network correlates with participants' partisan identification.

H2: The position of a participant within the network correlates with ingroup bias/affective polarization (i.e. evaluation of democrats vs republicans on a feeling-thermometer).

## Study 1a: Predicting latent group identities from attitude structures

H1: The position of a participant within the network correlates with participants' partisan identification.

$$r = .72^{***}$$

H2: The position of a participant within the network correlates with ingroup bias/affective polarization.

$$r = .73^{***}$$

## Robustness Check

Robustness check based on the representative 2020 ANES dataset (N = 8280) which included items that were equal or similar to the ones used in our study and obtained qualitatively similar results.

H1: The position of a participant within the network correlates with participants' partisan identification.

$$r = .73^{***} \text{ (vs. } r = .72)$$

H2: The position of a participant within the network correlates with ingroup bias/affective polarization.

$$r = .79^{***} \text{ (vs. } r = .73)$$

## Discussion

- Evidence that attitude-structures and the people who are holding them are connected in complex non-linear attitude-identity systems.
- In highly structured (i.e. polarized) opinion spaces, group identities are reflected (and defined) in compact attitude clusters.
- Attitude-identity systems are no "cold" cognitive phenomena but can be accompanied by "hot" group-based emotions

---

# • Study 1b: Exploring attitudes as identity signals

---

## Study 1b: Exploring attitudes as identity signals

Aim: Testing whether people can categorize others into groups based on attitude observance

### Procedure

- Same sample as in Study 1a (N = 398, 48.7% female, 50.05% male, 18-81 years, 58,1% Democrats, 13.9% Republicans, 28% Independents)
- Vignette study that exposes participants to a single attitude and ask them to 1) categorize and 2) emotionally evaluate a bogus persona who is holding that attitude

## Study 1b: Exploring attitudes as identity signals

**All unauthorized immigrants should be sent back to their home country.**

**Abortion should be illegal.**

**The government should regulate business to protect the environment.**

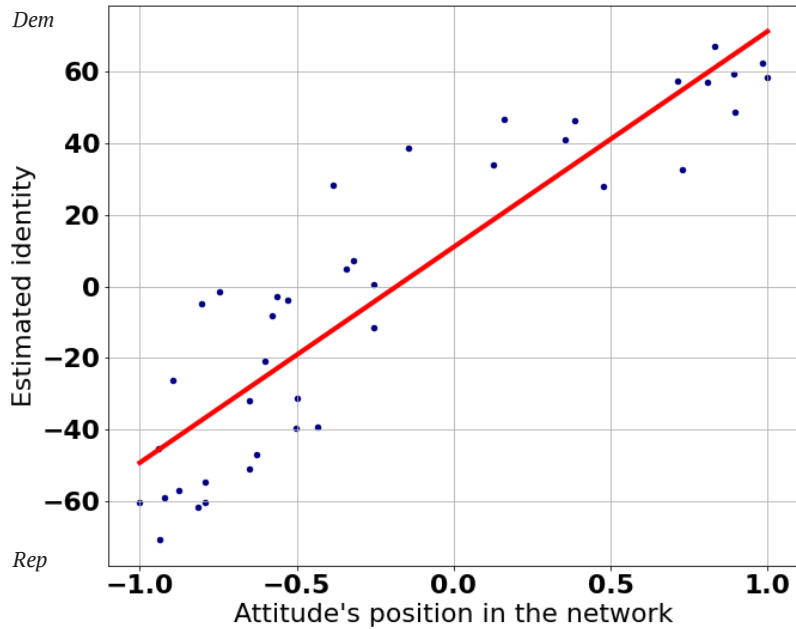

1) *In terms of political orientation, this person is...*

1 = "definitely not a Democrat" to 100 = "definitely a Democrat"  
1 = "definitely not a Republican" to 100 = "definitely a Republican"

2) *How do you feel towards this person?*

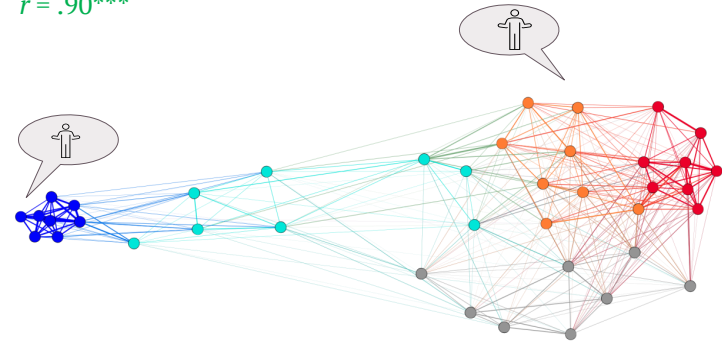

1 = "cold/unfavourable" to 100 = "warm/favourable"

## Study 1b: Exploring attitudes as identity signals

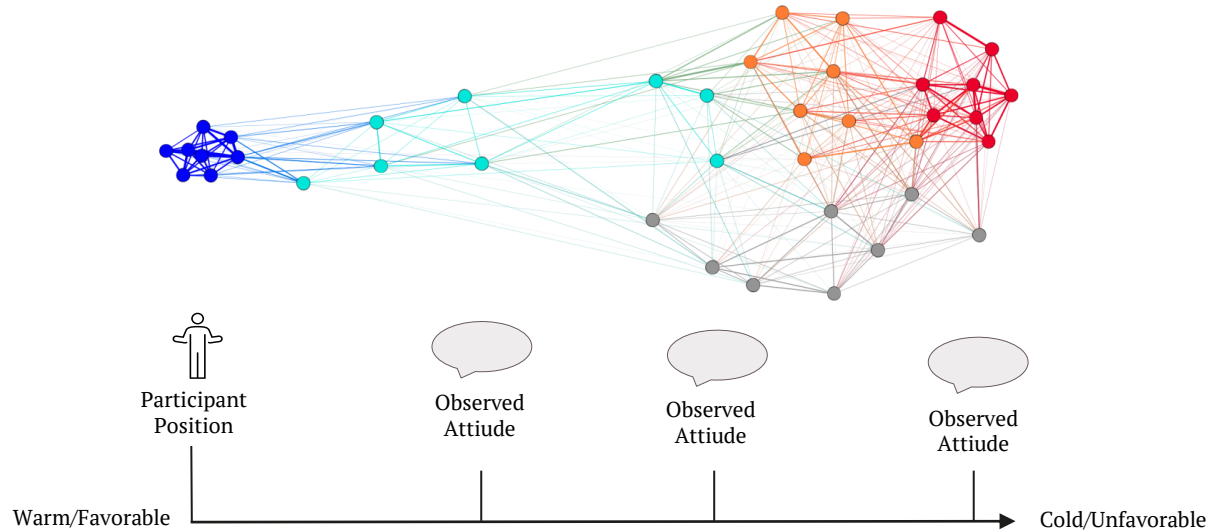

H3: The network position of an observed attitude corresponds to participants judgement of whether an attitude holder is a democrat or a republican.

$r = .90^{***}$

## Study 1b: Exploring attitudes as identity signals

H3: The distance in the attitude space between a participants' own position and the position of an attitude expressed on a vignette, correlates significantly with the evaluation of a bogus participant on a feeling thermometer.

## Study 1b: Exploring attitudes as identity signals

H3: The distance in the attitude space between a participants' own position and the position of an attitude expressed on a vignette, correlates significantly with the evaluation of a bogus persona on a feeling thermometer.

$$r = .49^{***}$$

## Discussion

- People seem to have a good mental representation of the investigated pool of attitude-identity relationships: Knowing only a single attitude provides sufficient information to locate others within the network.
- The results corroborate the claim that attitudes are *socially functional* – expressing and observing attitudes allows people to navigate identities.
- Relative attitude distance offers a basis for social judgement; presumably because attitudes signal **group identity** (see also Lelkes & Dias, 2021).

Some limitation addressed by follow-up study

- Using only highly polarized “hot button” issues may overestimate the accuracy of people’s mental representation of attitude-identity links
- Research suggests that individuals expect outgroups to be more extreme than they actually are (i.e. false polarization, Blatz & Mercier, 2018)

---

# Study 2

*Exploring (errors in) representations of ingroup and outgroup belief-systems*

---

## Study 2) Exploring (errors in) representations of ingroup and outgroup belief-systems

Aim: Advancing the understanding of how accurately attitude-structures are represented within the minds of individuals, and whether misrepresentations emerge as a function of group membership.

Sample:

N = 1007 US Partisans (48.4% female, 49.8% male, nb = 1.1; M(Age) =42.5 years; 41,5% Democrats, 35.7% Republicans, 20.4% Independents)

Design:

Step 1: Modelling a ResIN network based on self-reported attitudes

- 8 political hot-button issues (Study 1)
- 4 lifestyle-related issues (i.e. animal rights, modern art, divorce, science vs. religion, c.f. DellaPosta 2021)

Step 2: Building a represented attitude network based on an attitude-guessing game

## Exploring (errors in) representations of ingroup and outgroup belief-systems

### Gamified vignette design:

Please now consider William.

**William mildly agrees that the federal budget for welfare programs should be increased.**

How do you think **William thinks about whether abortion should be illegal?**

(Select each answer that seems plausible to you by ticking one or multiple boxes)

“William strongly disagrees that abortion should be illegal“

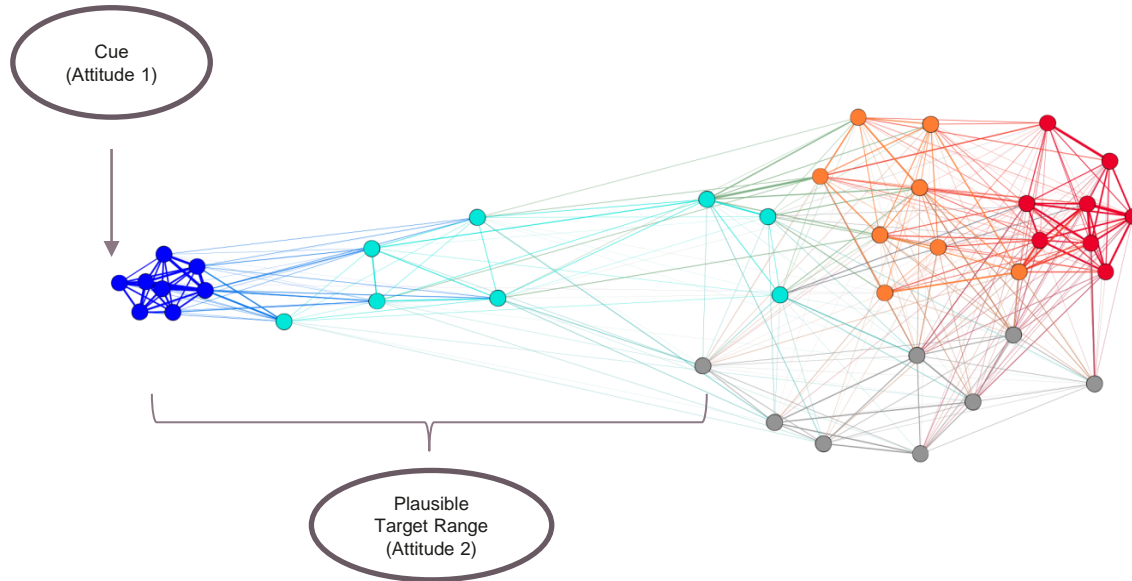

“William mildly disagrees that abortion should be illegal“

“William is neutral about whether abortion should be illegal“

“William mildly agrees that abortion should be illegal“

“William strongly agrees that abortion should be illegal“

## Exploring (errors in) representations of ingroup and outgroup belief-systems

---

Exploring (errors in) representations of ingroup and outgroup  
belief-systems

---

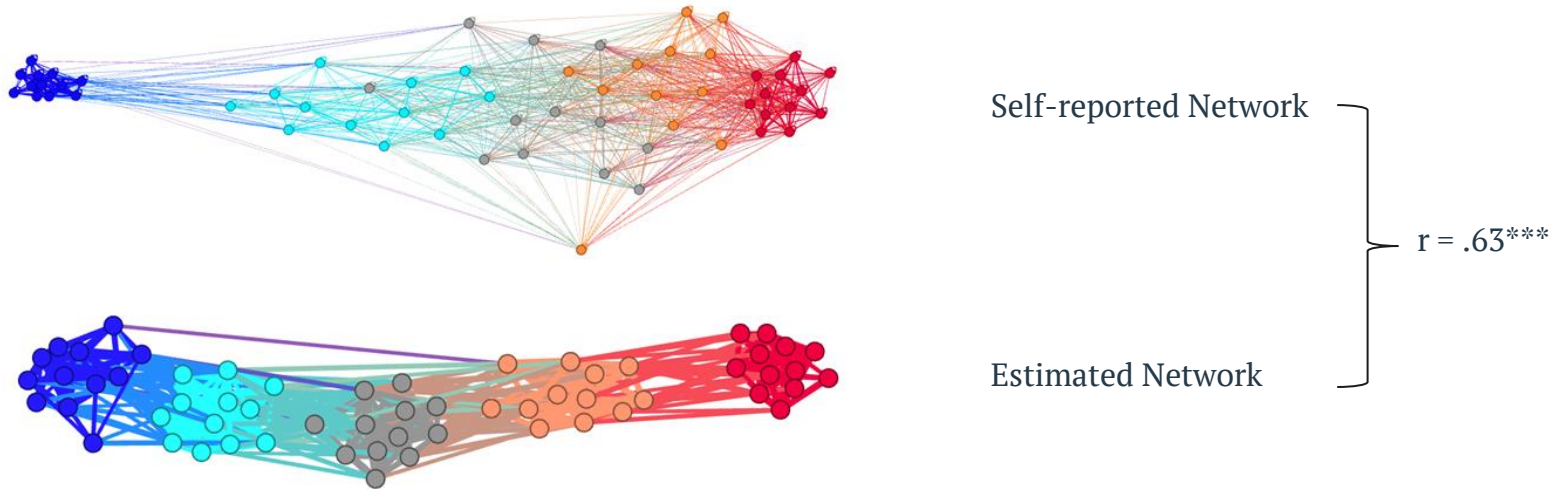

Research Question:

How accurate is participants' mental representations of the attitude space?

## Exploring (errors in) representations of ingroup and outgroup belief-systems

H1: Both, the real attitude space and the perceived attitude space are roughly structured in form of two distinguishable clusters of partisan-specific belief-sets.

---

## Exploring (errors in) representations of ingroup and outgroup belief-systems

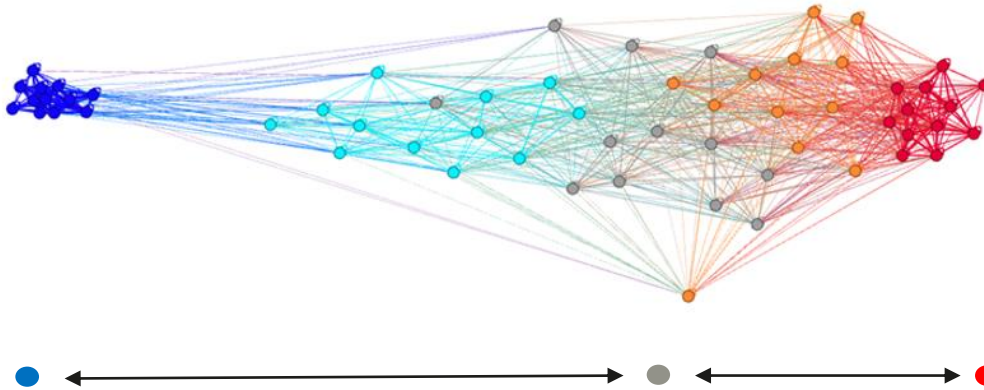

---

H2: False Polarization: Participants should perceive outgroup positions to be more extreme than they actually are. Accordingly, we predict that participants should overestimate the extremity of outgroup belief systems.

## Exploring (errors in) representations of ingroup and outgroup belief-systems

- We operationalize extremity as the estimated relative distance between neutral and extreme attitudes
- The extremity index was calculated as the average edge weight between extreme (blue and red) and neutral (grey) nodes

## Exploring (errors in) representations of ingroup and outgroup belief-systems

Real Network

Network estimated by Republicans

Democrat Extremety Index = .45  
Republican Extremety Index = .77

Network estimated by Democrats

Democrat Extremety Index = .17  
Republican Extremety Index = .81

### Discussion

- Despite the fact that people seem to have a good understanding of the attitudes that belong to different groups, there seem to be systematic biases underlying these mental representations.
- Preliminary data suggests that people tend to overestimate the extremity of outgroups (at least when compared to a group's self-perception)
- Plausible attitude structures for one group, may seem implausible for another
- Future research with ecological valid materials (e.g. social media posts) will be used to replicate the effects

*Thank  
you!*

### C) Attitude Network with Independents

In the following we report the network, where the nodes have been color coded based on their correlation with the self identification as “independents.” Specifically, pink represents more identification as independent, while yellow represents less.

In the republican representation

Strong support for the idea that ***“we trust too much in science and not enough in religious faith”*** is associated with strong support for the idea that ***“the federal government should make a concerted effort to improve social and economic conditions for African Americans”***.

Strong disagreement with the idea that ***“we trust too much in science and not enough in religious faith”*** is associated with strong disagreement that ***“animals should have the same moral rights that human beings do”*** and strong disagreement that ***“abortion should be illegal”***.
